

SijilChain – Blockchain Vehicle History Verification System

Overview

SijilChain is a blockchain-based solution designed to improve transparency in the used vehicle market by maintaining immutable vehicle history records linked to the Vehicle Identification Number (VIN).

Problem

Vehicle history records can become fragmented across ownership changes, making it difficult for buyers to verify accident histories, repairs, and other important information.

Solution

The proposed system uses blockchain technology to store tamper-proof vehicle records that remain permanently associated with a vehicle's VIN regardless of ownership changes.

Key Features

- VIN-based vehicle tracking
- Immutable vehicle history records
- Accident and repair tracking
- OTP-secured record access
- Auditability and transparency
- Blockchain-based verification

Technologies & Concepts

- Blockchain
- Decentralized Applications (DApps)
- Digital Identity Verification
- Vehicle Information Systems
- OTP Authentication

My Contributions

- Analyzed existing vehicle record processes
- Designed system workflows and architecture
- Defined stakeholder requirements
- Developed the VIN-based record management concept

Outcome

Proposed a secure and transparent vehicle history verification system that enhances consumer trust and reduces information fraud in vehicle transactions.
